

Personalized Prognostics: Can Genomic Testing Improve Your Melanoma Management?

The publication of this infographic was supported by Castle Biosciences.

Dermatol AMJ. 2025;2[1]:10-11. <https://doi.org/10.33590/dermatolamj/YPJV3422>

What is DecisionDx-Melanoma (31-GEP)?

Clinical utility of 31-GEP assay

Implementation of 31-GEP testing ensures that high-risk patients receive appropriate care.

Dermatologists ^{1,9}			Surgical oncologists ^{7,9,15}		
Optimizing clinic visits and follow-up care for improved patient management	Guiding referrals to surgical oncologists	Identifying low-risk patients who may not need intensive follow-up	Supporting decision-making regarding SLN biopsies	Reducing unnecessary surgical procedures by identifying patients with <5% SLN positivity risk	Identifying high-risk SLN-negative patients who may benefit from routine imaging to detect recurrence early

Implementation of 31-GEP testing improves patient outcomes.

	Reduction in unnecessary surgical procedures^{1,7,10-14} <ul style="list-style-type: none">•Prospective data show that the test accurately identifies patients at low risk for SLN positivity•Low-risk patients who forgo SLNB have a high RFS
	Early identification of high-risk patients^{3,7,15} <ul style="list-style-type: none">•The test facilitates timely interventions and enhanced surveillance strategies, which can lead to better patient outcomes•Routine imaging for high-risk, SLN-negative patients detected recurrence 10 months earlier

Routine imaging guided by 31-GEP results in earlier detection of melanoma.¹⁵

What makes 31-GEP testing unique?

1 Extensive independent validation

It is one of the most validated melanoma prognostic tests, supported by:^{1,3,9,16}

- >50 peer-reviewed studies
- Data from over 10,000 patients

2 Comprehensive, actionable risk prediction

The independently validated 31-GEP score is integrated with clinicopathologic features through two proprietary algorithms to inform:

- SLN positivity** (i31-SLNB): 31-GEP score combined with age, ulceration, Breslow thickness, and mitotic rate^{11,17}
- Risk of recurrence** (i31-ROR): 31-GEP score combined with age, ulceration, Breslow thickness, mitotic rate, SLN status, and tumor location^{2,18}

3 Proven clinical impact

It is the only melanoma test associated with improved patient survival:^{6,16}

- MSS^{4,7,8}
- RFS^{4,7,8}
- DMFS^{4,7,8}
- OS^{6,11}

Key Takeaways

Provides personalized risk assessment for melanoma patients through molecular-level tumor analysis, supported by extensive clinical evidence from over 10,000 patients across 50+ peer-reviewed studies.^{1,3,9,16}

Improves clinical decision-making by helping physicians identify appropriate candidates for SLNB and enabling early interventions for high-risk patients.^{1,7,9,15}

Demonstrates real-world impact on patient survival through better risk stratification and optimized treatment planning, making it the only melanoma test with proven survival benefits.^{4,6-8,11,16}
